5 Cell safety criterion 电芯安全准则

5.1 Design and usage of chargers and battery packs 充电器和电池组设计及使用注意事项

5.1.1 Charge 充电

5.1.1.1 The cell should be charged by constant current charge - constant voltage charge. The charging voltage of a single cell should not exceed 4.20V, and the cut-off current of charging should be greater than or equal to 1/50C (52mA). Considering the control deviation of the charger, the charging voltage of the cell must be lower than 4.20V. Even in exceptional circumstances, the charging voltage shall not exceed 4.25V to avoid overcharging. Charging voltage higher than 4.20V will shorten the cell cycle life.

电芯应该使用恒流充电-恒压充电的方式进行充电。单体电芯的充电电压不能超过 4.20V，充电截止电流大于等于 1/50C (52mA)。考虑到充电器的控制偏差，必须保证电芯充电电压低于 4.20V。即使在异常情况下，充电电压不可超过 4.25V 以避免过充电。充电电压高于 4.20V 会导致电芯循环寿命缩短；

5.1.1.2 The charger should have a pre-charging system and the pre-charging function could be used to prevent abnormal high power charging after deep discharge. After long-term storage, When the cell voltage is lower than 2.75V (0%SOC), the cell must be pre-charged with a current lower than 0.1C until the cell voltage is higher than 2.75V, then charge in standard mode. If the cell voltage cannot be charged to 2.75V within 30 minutes, the charger shall stop charging;

充电器应该带有预充电系统，预充电功能应该应用于阻止深度放电后不正常的大倍率充电。当长期存储电芯电压低于 2.75V (0%SOC) 时，必须使用低于 0.1C 电流对电芯进行预充电，直到电芯电压高于 2.75V 再进行标准方式充电。如果电芯电压在 30 分钟内无法充至 2.75V，充电器需停止充电；

5.1.1.3 Chargers should be equipped with a complete charge detection device. The charging detection device can be checked by timer, current detection or open circuit voltage detection to detect the charging state. When the charging detection device detects that the cell is fully charged, the charging circuit should be completely cut off to avoid trickling charge. The cell charge should be carried out at the temperature of 0 °C ~ +45 °C. When the cell temperature exceeds this range, it should be placed until the cell temperature reaches the above range.

充电器应该配备一个完整的充电检测装置。充电检测装置能够通过计时器、电流检测或者开路电压检测，检测到电池满充电的状态。当充电检测装置检测到电池充满电后，应该完全切断充电电路。避免产生涓流充电；电芯充电应在温度为 0 °C ~ +45 °C 下进行，当电芯温度超出此范围时，应静置到电池温度达到以上范围后再行充电。

5.1.2 Discharge 放电

5.1.2.1 Single cell discharge current should be less than maximum discharge current.

单体电芯放电电流需小于最大放电电流。

5.1.2.2 The discharge cut off voltage of the cell shall be higher than 2.75V;

电芯放电终止电压需高于 2.75V；

5.1.2.3 The discharge environment temperature of the cell range from -20 °C to +60 °C. During the discharge process, if the surface temperature of the cell exceeds 70 °C, the discharge must be terminated.

电芯放电环境温度范围为-20 °C ~ +60 °C，放电过程中，如果电芯表面温度超过 70 °C，必须终止放电。

5.1.3 Over-discharges 过放电

If the voltage of a single cell is lower than 2.75V, the cell is considered to be over discharged and cannot be used

anymore.

如果单体电池的电压低于 2.75V,电池被认为是过放电,不能继续使用。

5.1.4 Storage 存储

The cell should be stored in a dry (0~45%RH) and non-corrosive gas environment, do not allow the cell to bear any pressure, and there should be no condensed liquid attached to the surface of the cell.

电芯应在干燥（0~45%RH）无腐蚀性气体的环境下储存，不要让电芯承受任何压力，且不能有冷凝液体附着在电芯表面。

| Item 项目 | Conditions 环境 | Permissible time 允许时间 |
|---|--------------------|-------------------------------------|
| Storage environment 存储环境 | -20 ℃~+40 ℃ | Less than 3 month 3 个月之内 |
| | -20 ℃~+20℃, ≤50%RH | 3 months to 12 months 3 个月~12 个月 |
| <p>Long-term storage, the cell must be 10%~35%SOC , and need to carry out voltage detection before use. 长期存储，电芯必需处于荷电 10%~35%SOC 状态，并且使用前需要进行电压检测。</p> <p>Storage life longer than 12 months, the battery must be recharged to 10%~35% SOC state of charge 存储时间大于 12 个月必须对电池进行补电至荷电 10%~35%SOC 状态</p> | | |

5.1.5 Considerations for battery pack design 电池组设计的注意事项

5.1.5.1 The shape, mechanism and material of the battery pack 电池组的形状、机理和材料

电池组设计应该保证其不能被未授权的充电器进行充电。电池组设计应该保证其不能与未授权的设备进行连接。

The positive and negative ends of the battery pack should be designed to avoid short circuit or reverse connection.

电池组正负极两端应该设计成避免短路或正负极发生反接的结构。

In addition, the battery pack should have an overcurrent protection device to avoid the occurrence of external short circuit.

此外，电池组应该有过电流保护功能的装置，来避免外短路的情况发生。

The battery pack should be designed to prevent static electricity and dust, liquids, etc.

电池组设计应该具有防静电功能并且能够阻止灰尘、液体等侵入

The design of the battery pack should ensure that the cells are fixed in the battery pack and not arbitrarily movable. The battery pack shall be structurally designed to prevent the occurrence of dents, deformations or other mechanical stresses on the cells in the event of a predictable fall.

电池组设计上应保证电池固定在电池组内，不能任意移动。电池组在结构上应保证在出现可预见的跌落后不能使电池出现凹痕，变形和其他机械应力。

The flammability of materials used in the battery pack, such as double-sided tape and rubber, should be verified. 电池组使用的材料例如双面胶带和橡胶应该验证其可燃性。

5.1.5.2 **Battery pack structure (Cell number limitation) 电池组结构（电池组限制使用的电池数量）**

The number of parallel connections is unlimited, but the battery pack must pass the overcharge test (the charging current of the overcharge test is the product of the maximum charging current of the charger and the number of parallel connections).

并联个数无限制 但是电池组必须通过过充电测试（过充测试的充电电流为充电器的最大充电电流与并联数量的乘积）。

The number of serial connections is unlimited, and series fuses are required.

串联个数无限制，需要保险丝。

The cell should be kept away from heating electronic components to avoid deterioration of cell performance. Insulation should be provided between the PCB'A and the battery pack (e.g. plastic barrier for air isolation or non-thermal conductive insulation).

电池应该远离发热电子元器件以避免电池性能的劣化。PCB'A 线路板和电池组之间应该有绝热材料进行隔绝（例如塑料屏障给予空气隔离或非导热电材料隔离）。

If the discharge current of a single cell exceeds about maximum discharge current, the overcurrent protection should cut off the discharge current.

如果单体电池放电电流超过最大持续放电电流，过电流保护应该切断放电电流。

Protection circuit power consumption

保护电路功耗

In order to avoid over discharge mode in long-term storage, the current consumption of the battery pack protection circuit should be set as small as possible. When it is not in use for a long time, it is necessary to check the residual state of the cell regularly and ensure that each single cell in the battery pack cannot reach the over-discharge state.

为了避免长期存储出现过放电模式，电池包保护线路的消耗电流应该设置的尽量小。长期未使用时，要定期检查电量剩余状态，要确保电池组内各单体电芯不能达到过放状态。

5.1.5.4 Cell connection 电池连接
